

Project Title

Metro Ticket Generating System in ServiceNow

Name : Tamminana Harshitha
College : Aditya Institute of Technology and
Management

Email : 23a51a1259@adityatekkali.edu.in

Project Report

Date	28 June 2026
Team ID	Individual
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	

Project Overview

The Metro Ticket Generating System in ServiceNow is developed to simplify and automate the metro ticket booking process for passengers. Traditional ticket booking methods often involve long waiting queues, manual fare calculation, and delays in ticket generation, resulting in inconvenience for passengers and increased workload for metro administrators.

This solution utilizes the ServiceNow platform to automate the complete ticket booking lifecycle. Passengers can book metro tickets through the Service Catalog by selecting the source station, destination station, and travel details. The system automatically validates the booking information, calculates the fare, generates a unique QR- code- based digital ticket, stores the booking details, and sends instant confirmation notifications with minimal manual intervention.

The project integrates various ServiceNow components, including Service Catalog, Catalog Variables, Custom Tables, Flow Designer, UI Policies, Notifications, and QR Code Generation, to develop a secure, reliable, and user- friendly metro ticket booking system. By automating the ticket booking process, the solution reduces waiting time, improves fare calculation accuracy, enhances the passenger experience, maintains booking records, and increases the overall efficiency of metro op

1. Introduction :

In today's fast-paced world, public transportation plays a vital role in the daily lives of millions of commuters. Metro rail systems are widely used because they provide a fast, economical, and reliable mode of transportation. However, traditional metro ticket booking methods often involve long waiting queues, manual fare calculation, physical ticket issuance, and delays during peak hours, leading to inconvenience for passengers and increased workload for metro staff.

As the number of metro passengers continues to increase, managing ticket bookings manually becomes less efficient and more time-consuming. This can result in longer waiting times, booking errors, reduced operational efficiency, and limited visibility into ticket booking records. To overcome these challenges, there is a need for an automated and user-friendly ticket booking system.

The Metro Ticket Generating System, developed using the ServiceNow platform, provides a centralized and automated solution for booking metro tickets. Passengers can easily book tickets through the Service Catalog by selecting the source station, destination station, and travel details. The system automatically calculates the fare, generates a QR-code-based digital ticket, stores booking information in custom tables, and sends confirmation notifications through automated workflows.

The proposed system offers the following benefits:

- Faster and hassle-free metro ticket booking.
- Automatic fare calculation based on selected stations.
- Instant generation of QR-code-based digital tickets.
- Reduced manual effort and waiting time.
- Secure storage and management of booking records.
- Automated notifications and booking confirmations.
- Improved passenger convenience and overall travel experience.
-

By utilizing the low-code capabilities of ServiceNow, this project demonstrates how digital automation can simplify metro ticket booking operations while improving service efficiency, accuracy, and scalability for future enhancements.

2. Project Objectives :

The main objective of this project is to develop a Metro Ticket Generating System using the ServiceNow platform to simplify and automate the metro ticket booking process. The system provides a centralized platform for passengers to book metro tickets while automating fare calculation, ticket generation, QR code creation, booking record management, and notification services. This reduces manual effort, minimizes waiting time, and improves the overall passenger experience.

The specific objectives of the project are:

- Develop a centralized Service Catalog for metro ticket booking.
- Design a user- friendly booking form using Catalog Variables and UI Policies.
- Create Custom Tables to store passenger and ticket booking details.
- Automate the ticket booking process using Flow Designer.
- Calculate ticket fares automatically based on the selected source and destination stations.
- Generate QR- code- based digital tickets for secure passenger travel.
- Send automatic email notifications with booking confirmation and ticket details.
- Maintain booking history and ticket records for tracking and future reference.
- Develop a scalable solution that can support additional metro routes and services in the future.

3. Key Features

The proposed Metro Ticket Generating System in ServiceNow includes the following key features:
User- friendly Service Catalog for booking metro tickets.

- Dynamic booking form with Catalog Variables to capture passenger and journey details.
- Automatic fare calculation based on the selected source and destination stations.
- Flow Designer automation for processing ticket booking requests.
- Generation of QR- code- based digital tickets for secure travel.
- Custom Metro Ticket Table for storing and managing booking records.
- Automatic creation of ticket records after successful booking.
- Instant email notifications with booking confirmation and ticket details.
- Easy management of metro stations, fare details, and bookings by administrators.
- Secure storage of passenger and booking information for future reference and reporting.

4. Project Milestones

The project implementation follows five major milestones.

Milestone 1: Service Catalog Creation

Objective

Establish a structured Service Catalog for metro ticket booking.

Activities:

- Identify the ticket booking requirements.
- Create the Service Catalog.
- Create Catalog Categories.
- Create the Metro Ticket Booking Catalog Item.
- Provide meaningful names and descriptions.
- Organize the catalog for easy passenger access.

Milestone 2: Booking Form Setup

Objective

Design a dynamic booking form to collect passenger and journey details.

Activities:

- Create Catalog Variables.
- Configure Variable Sets.
- Implement Catalog UI Policies.
- Configure mandatory fields.
- Apply field validation.
- Enable dynamic field visibility based on user input.

Milestone 3: Ticket Booking Automation

Objective

Automate the complete metro ticket booking process.

Activities:

- Create Flow Designer workflows.
- Automate fare calculation.
- Generate QR- code- based digital tickets.
- Store booking details in the Custom Metro Ticket Table.
- Send booking confirmation email notifications.

Milestone 4: Testing

Objective

Validate the complete metro ticket booking workflow.

Activities:

- Unit Testing.
- Catalog Item Testing.
- Flow Designer Testing.
- Fare Calculation Testing.
- QR Code Generation Testing.
- Email Notification Testing.
- User Acceptance Testing (UAT).

Milestone 5: Deployment

Objective

Deploy the Metro Ticket Generating System for end users.

Activities:

- Validate all configurations.
- Publish the Metro Ticket Booking Catalog Item.
- Monitor Flow execution.
- Train end users.
- Monitor system performance after deployment.

5. ServiceNow Developer Setup

Before developing the Metro Ticket Generating System, a ServiceNow Personal Developer Instance (PDI) must be created. The PDI provides a fully functional ServiceNow environment where the metro ticket booking application can be designed, developed, tested, and deployed without affecting production systems.

5.1 Creating a ServiceNow Developer Account

To begin development, perform the following steps:

1. Visit the ServiceNow Developer Portal.
2. Click Sign Up to create a free developer account.
3. Enter the required information:
 - o First Name
 - o Last Name
 - o Email Address
 - o Password
4. Verify your email address using the activation link sent to your registered email.
5. Log in to the ServiceNow Developer Portal.
6. Click Start Building.
7. Request a Personal Developer Instance (PDI).
8. Wait for the instance to be provisioned.
9. Launch the instance and log in using the generated credentials.

5.2 Accessing Creator Studio

Once the Personal Developer Instance is ready, ServiceNow redirects the developer to Creator Studio. Creator Studio provides a low- code and no- code development environment for building the Metro Ticket Generating System. It allows developers to create the Service Catalog, booking forms, custom tables, Flow Designer workflows, notifications, and automation using an intuitive graphical interface.

Creator Studio is used in this project to develop:

- Metro Ticket Booking Service Catalog
- Catalog Variables and Variable Sets
- Custom Metro Ticket Tables
- Flow Designer Automation
- Fare Calculation Logic
- QR- Code- Based Ticket Generation
- Email Notifications
- Booking Record Management

6.1 Service Catalog Creation

The Service Catalog acts as a centralized self- service portal that enables passengers to book metro tickets easily. In this project, a catalog item named Metro Ticket Booking was created to provide users with a single interface for booking metro tickets by selecting the source station, destination station, and travel details. The system automatically processes the booking request, calculates the fare, generates a QR- code- based digital ticket, and sends a confirmation notification.

Steps to Create the Service Catalog Item

1. Open the Application Navigator in the ServiceNow platform.
2. Search for Service Catalog.

3. Navigate to the following path:
Service Catalog → Maintain Items
4. Click the New button to create a new catalog item.
5. Enter the required details:
 - o Catalog Item Name: Metro Ticket Booking
 - o Catalog: Service Catalog
 - o Category: Transportation (or Metro Services)
 - o Short Description: Metro Ticket Generating System
6. Click Save to create and store the catalog item successfully.

Purpose of the Catalog

The Service Catalog serves as the primary interface through which passengers can book metro tickets. It provides a centralized and user- friendly platform that simplifies the ticket booking process and enables passengers to complete their bookings quickly and efficiently.

Using the Metro Ticket Booking catalog item, users can:

- Select the Source Station.
- Select the Destination Station.
- View the automatically calculated fare.
- Generate a QR- code- based digital ticket.
- Receive booking confirmation and ticket details via email.
- View and manage their booking details.

By providing a single point of access for metro ticket booking, the Service Catalog eliminates the need for manual ticket counters and lengthy waiting queues. It ensures a faster, secure, and automated booking process while improving passenger convenience, maintaining accurate booking records, and enhancing the overall efficiency of metro ticket management.

6.2 Catalog Variables Configuration

Catalog Variables are used to collect the necessary information from passengers when they book a metro ticket. These variables appear as input fields on the Metro Ticket Booking Service Catalog form and capture the details required to process the booking.

The information entered through these variables is later used by Flow Designer to validate the booking request, calculate the ticket fare, generate a QR- code- based digital ticket, store booking details in the custom table, and send confirmation notifications to the passenger.

Steps to Create Catalog Variables

Follow the steps below to configure catalog variables:

1. Open the Metro Ticket Booking catalog item.
2. Navigate to the Variables related list.
3. Click the New button to add a new variable.
4. Configure the required properties, including:
 - o Variable Type
 - o Question
 - o Name
 - o Order
 - o Tooltip
 - o Help Text
 - o Mandatory Status
5. Click Save to create the variable.
6. Repeat the above procedure until all required catalog variables have been added to the Metro Ticket Booking catalog item.

Catalog Variables Used in the Project

-
- Passenger Name
 - Email Address
 - Source Station
 - Destination Station
 - Journey Date
 - Number of Passengers
 - Ticket Type (Single/Return, if applicable)

These catalog variables ensure that all the required booking information is collected accurately, enabling the system to automate fare calculation, ticket generation, and notification processes efficiently.

Variable Configuration

The Metro Ticket Booking catalog item consists of different types of variables to collect all the information required for booking a metro ticket. Each variable is selected based on the type of data that needs to be captured from the passenger.

Variable Name	Variable Type
Passenger Details	Container Start
Passenger Name	Single Line Text
Email Address	Email
Journey Details	Container Start
Source Station	Select Box
Destination Station	Select Box

Journey Date	Date
--------------	------

Types of Variables Used

1. Single Line Text

A Single Line Text variable is used to capture short text values entered by the passenger.

Examples:

Passenger Name

Email Address

2. Select Box

A Select Box allows passengers to choose one option from a predefined list.

Examples:

Source Station

Destination Station

3. Multiple Choice

A Multiple Choice variable allows users to select one option from the available choices.

Example:

Ticket Type

Available options include:

Single Journey

Return Journey

4. Date

The Date variable allows passengers to select their travel date.

Example:

Journey Date

5. Integer

The Integer variable is used to capture numeric values.

Example:

Number of Passengers

6. Multi- Line Text

A Multi- Line Text variable is used when passengers need to provide additional information.

Example:

Special Requests

Additional Travel Information

Auto- Populated Variables

- To improve efficiency, some passenger details can be automatically populated using ServiceNow features after login.
- The automatically populated fields include:

- Passenger Name
- Email Address
- This automation reduces manual data entry, improves accuracy, and speeds up the ticket booking process.

Advantages of Catalog Variables

- The use of Catalog Variables provides several benefits, including:
- Standardized collection of passenger information.
- Improved accuracy of booking details.
- Simplified ticket booking process.
- Automatic fare calculation and QR- code ticket generation.
- Better booking record management and reporting.
- Reduced manual effort and faster ticket processing

6.3 Variable Set Configuration

A Variable Set is a reusable collection of catalog variables that can be attached to one or more catalog items. Instead of creating the same variables repeatedly, developers can create them once and reuse them wherever required. This improves consistency, simplifies maintenance, and reduces development time.

In the Metro Ticket Generating System, the Variable Set is used to collect common passenger details required during the ticket booking process.

Some commonly reused variables include:

- Passenger Name
- Email Address
- Journey Date
- Number of Passengers
- Mobile Number

Steps to Create a Variable Set

1. Open the Application Navigator and navigate to:
Service Catalog → Variable Sets
2. Click New to create a new Variable Set.
3. Enter the required information:
 - o Name
 - o Description
4. Add all the required variables to the Variable Set.
5. Click Save to create the Variable Set.
6. Associate the created Variable Set with the Metro Ticket Booking catalog item for reuse.

Advantages of Variable Sets

Using Variable Sets in the Metro Ticket Generating System offers several benefits:

- Eliminates repetitive creation of common passenger details.
- Simplifies maintenance by updating variables in one place.
- Provides a consistent booking experience for passengers.
- Enables the same passenger details to be reused across multiple metro- related catalog items.
- Reduces development time and improves application efficiency.
- Ensures accurate and standardized data collection during ticket booking.

6.4 Catalog UI Policy Configuration

Catalog UI Policies are used to make the Metro Ticket Booking form more interactive by controlling the visibility,

mandatory status, and read- only behavior of catalog variables based on the passenger's selections. These policies help create a dynamic booking form that displays only the fields relevant to the selected travel details. In this project, Catalog UI Policies are configured to show or hide specific variables based on the passenger's input. This simplifies the booking form, reduces unnecessary data entry, and improves the overall user experience.

Objective

- The implementation of Catalog UI Policies is intended to achieve the following objectives:
- Improve the usability and appearance of the metro ticket booking form.
- Display only the fields required for the selected booking options.
- Dynamically show or hide variables based on passenger selections.
- Make fields mandatory only when necessary.
- Prevent incomplete or incorrect ticket bookings.

Example Scenario

The UI Policies are configured to respond dynamically to passenger input.

For example:

If the passenger selects Ticket Type = Return Journey, an additional field "Return Journey Date" is displayed.

If the passenger selects Number of Passengers > 1, an additional field "Passenger Details" becomes visible to enter the details of all passengers.

This dynamic behavior ensures that passengers are presented only with the fields required for their booking.

Steps to Configure a Catalog UI Policy

- Open the Application Navigator and navigate to:
- Service Catalog → Catalog Definitions → Maintain Items
- Open the Metro Ticket Booking catalog item.
- Scroll to the Catalog UI Policies related list.
- Click New to create a Catalog UI Policy.
- Enter the required details:
- Applies To: Catalog Item
- Catalog Item: Metro Ticket Booking
- Description: Dynamic Field Visibility
- Configure the policy condition.
- Example Condition:
- Ticket Type = Return Journey
- Click Save.
- Create a UI Policy Action.
- Select the variable Return Journey Date.
- Set the Visible property to True.
- Update and save the UI Policy.
- Open the catalog item and verify that the fields are displayed dynamically based on the selected conditions.

Benefits of UI Policies

- Implementing Catalog UI Policies provides several advantages:
- Creates dynamic and interactive metro ticket booking forms.
- Improves the passenger booking experience.
- Displays only the relevant fields, keeping the form clean and simple.
- Reduces errors during ticket booking.
- Ensures accurate collection of passenger and journey information.
- Makes the booking process faster and more efficient.

Objective

The implementation of Catalog UI Policies is intended to achieve the following objectives:

Improve the usability and appearance of the request form.
Minimize user confusion by displaying only relevant fields.
Dynamically show or hide variables based on user selections.
Make fields mandatory only when they are applicable.
Prevent incomplete or incorrect request submissions.

Example Scenario

The UI Policies are configured to respond dynamically to user input.

For example:

If the user selects Device Type = Others, an additional field named "Please Specify Device" is displayed.
If the Request Type is selected as Relocation, the Relocation Address field becomes visible, allowing the user to enter the required location details.

This dynamic behavior ensures that users are presented only with fields relevant to their selected request.

Steps to Configure a Catalog UI Policy

1. Open the Application Navigator and navigate to:
Service Catalog → Catalog Definitions → Maintain Items
2. Open the Network Request catalog item.
3. Scroll to the Catalog UI Policies related list.
4. Click New to create a Catalog UI Policy.
5. Enter the required details:
Applies To: Catalog Item
Catalog Item: Network Request
Description: Dynamic Field Visibility
6. Configure the policy condition.
Example Condition: Device Type = Others
7. Save the Catalog UI Policy.
8. Create a UI Policy Action.
9. Select the variable Please Specify Device.
10. Set the Visible property to True.
11. Update and save the UI Policy.
12. Open the Catalog Item and verify that the fields are displayed dynamically based on the selected conditions.

Benefits of UI Policies

Implementing Catalog UI Policies provides several advantages in improving the overall functionality and usability of the Service Catalog:

fields.	Creates dynamic and interactive request forms.
	Enhances the overall user experience.
	Maintains a clean and organized interface by displaying only relevant
	Minimizes validation errors during form submission.
	Improves the quality and accuracy of collected information.

6.5 Creation of Custom Table

A Custom Table was created in ServiceNow to maintain all metro ticket booking records in a dedicated database. Instead of relying only on Service Catalog request records, this table stores complete passenger and booking information, making it easier for administrators to manage bookings, monitor ticket history, and generate reports. Having a separate table also supports workflow automation, simplifies record management, and provides flexibility for future enhancements such as ticket cancellation, refund processing, and booking analytics.

Table Details

Table Name: Metro Ticket Details

Purpose:

To store and manage all submitted metro ticket booking records in a centralized location for tracking, reporting, and administrative purposes.

Steps to Create the Custom Table

1. Open the Application Navigator.
2. Navigate to:
3. System Definition → Tables
4. Click New to create a table.
5. Enter the required details:
6. Label: Metro Ticket Details
7. Table Name: Metro Ticket Details
8. Application: Metro Ticket Generating System
9. Enable the Auto Generate Schema option.
10. Click Submit to create the custom table.

Fields in the Custom Table

- The custom table stores the following information:
- Ticket ID
- Passenger Name
- Email Address
- Source Station
- Destination Station
- Journey Date
- Number of Passengers
- Ticket Fare
- QR Code

- Booking Status
- Created Date

Advantages of the Custom Table

- The custom table offers several benefits, including:
- Centralized storage for all metro ticket booking records.
- Easy management of passenger and booking information.
- Simplified report generation and booking analysis.
- Improved tracking and auditing of ticket bookings.
- Easy integration with future enhancements such as ticket cancellation and fare updates.
- Independent management of metro ticket- related data.

6.6 Field Creation

Once the custom table was created, the required fields were added to store the information collected through the Metro Ticket Booking Service Catalog. Each field in the table corresponds to a catalog variable, ensuring that all booking details are stored systematically. These fields act as the database structure used by Flow Designer, reports, notifications, and administrative processes.

Steps to Create Table Fields

1. Open the Metro Ticket Details custom table.
2. Navigate to the Columns tab.
3. Click New to add a new field.
4. Select the appropriate Field Type.
5. Enter the Column Label.
6. Specify the Column Name.
7. Click Save to create the field.
8. Repeat these steps until all required fields have been added to the table.

Field Name	Data Type
Ticket Number	String
Passenger Name	String
Email Address	String
Source Station	Choice
Destination Station	Choice
Journey Date	Date
Number of Passengers	Integer
Ticket Type	Choice
Ticket Fare	Decimal
QR Code	String
Booking Status	Choice
Booking Date	Date/

Purpose of the Fields

These fields help store all the information related to a metro ticket booking, including passenger details, journey information, fare, QR code, and booking status. The stored data is used for ticket generation, booking history, reporting, and future enhancements such as ticket cancellation and refund management.

6.7 Flow Designer Implementation

Flow Designer is the primary automation component used in this project to manage the complete metro ticket booking process. It automatically executes a sequence of predefined actions whenever a passenger submits a booking request through the Service Catalog. By automating tasks such as fare calculation, ticket generation, record creation, QR code generation, email notifications, and status updates, the flow significantly reduces manual effort and improves the efficiency of the ticket booking process.

The automated workflow ensures that every booking follows a consistent process from submission to ticket generation while maintaining accuracy, transparency, and reducing processing time.

6.7.1 Flow Creation

Objective

Create a flow to automate the complete lifecycle of a metro ticket booking.

Steps to Create the Flow

1. Open the Application Navigator and search for Flow Designer.
2. Launch Flow Designer.
3. Click New → Flow.
4. Enter the following details:
 - o Flow Name: Metro Ticket Booking Flow
 - o Description: Automates the metro ticket booking and ticket generation process.
5. Click Build Flow.

6.7.2 Configuring the Trigger

The Trigger starts the flow automatically whenever a passenger submits the Metro Ticket Booking catalog item.

Steps

1. Click + Add Trigger.
2. Select Service Catalog.
3. Choose Requested Item Created.
4. Select Metro Ticket Booking catalog item.
5. Save the trigger.

6.7.3 Get Catalog Variables

After the flow starts, the Get Catalog Variables action retrieves the passenger information entered in the booking form.

Steps

1. Click Add Action.
2. Select Get Catalog Variables.
3. Choose Requested Item.
4. Select the required catalog variables.
5. Save the action.

Retrieved Variables

- Passenger Name
- Email Address
- Source Station
- Destination Station
- Journey Date
- Number of Passengers
- Ticket Type

6.7.4 Create Record

After retrieving the catalog variables, a new record is created in the Metro Ticket Details custom table.

Steps

1. Click Add Action.
2. Select Create Record.
3. Choose Metro Ticket Details table.
4. Map the catalog variables to the table fields.
5. Save the action.

The booking information is now stored in the database.

6.7.5 Fare Calculation

The workflow automatically calculates the ticket fare based on the selected Source Station and Destination Station.

Steps

1. Add a Flow Designer Action.
2. Retrieve the selected stations.
3. Calculate the fare.
4. Store the calculated fare in the custom table.
5. Continue to the next action.

6.7.6 QR Code Ticket Generation

Once the booking details and fare are processed, the system generates a unique QR- code-based digital ticket.

The QR code contains:

- Ticket Number
- Passenger Name
- Source Station
- Destination Station
- Journey Date
- Ticket Fare

The generated ticket is stored and linked to the booking record.

6.7.7 Email Notifications

To keep passengers informed, the system automatically sends email notifications during the booking process.

Email Notifications

- Ticket Booking Submitted
- Ticket Successfully Generated
- QR Code Ticket Attached
- Booking Confirmation

Each email includes:

- Passenger Name
- Ticket Number
- Journey Details
- Fare
- QR Code

6.7.8 Update Record

After the ticket is generated, the booking record is automatically updated.

Updated Fields

- Booking Status
- Ticket Number
- Ticket Fare
- QR Code
- Booking Date

This ensures that the latest booking information is always available.

6.8 Workflow Summary

The following sequence describes the complete workflow of the Metro Ticket

Generating System:

1. The passenger opens the Metro Ticket Booking catalog item.
2. The passenger enters journey details and submits the booking.
3. Flow Designer is automatically triggered.
4. The flow retrieves all catalog variables.
5. A booking record is created in the Metro Ticket Details table.
6. The system automatically calculates the ticket fare.
7. A unique QR- code- based digital ticket is generated.
8. Booking details are stored in the database.
9. A confirmation email with the ticket and QR code is sent to the passenger.
10. The booking status is updated to Ticket Generated.

7. Screenshots of Output

1. Flow Execution Test

The screenshot displays the 'Book A Metro Ticket' web application interface. The top navigation bar includes links for Knowledge, Catalog, Requests, System Status, Cart, Tours, and a user profile for System Administrator. The breadcrumb trail shows the path: Home > Service Catalog > Office > Services > Book A Metro Ticket. A search bar is located in the top right corner.

The main content area is titled 'Book A Metro Ticket' and includes a sub-header: 'A metro e-ticketing system allows passengers to purchase and use tickets digitally, typically via a mobile app or website, eliminating the need'. Below this, a form titled 'What do you want to do Today?' contains a dropdown menu with 'Book Ticket' selected. The form also includes input fields for 'Starting From', 'Going To', 'No of Passengers', 'Type of Journey' (with 'Single Journey' selected), 'Amount for Single Journey', 'Amount Including Return', and 'Mode of Payment'. A sidebar on the right shows 'Quantity: 1', 'Delivery Time: 0 Days', and buttons for 'Add to Cart', 'Save as Draft', and 'Order Now'.

2.QR SCAN&TICKET DETAILS

Metro E-Ticket

Ticket	RITM0010020
Starting	Central Station
Destination	City Mall
Passengers	15
Journey	Return Journey
Fare	600

8.Conclusion

The Automated Network Request Management project demonstrates the effectiveness of using the

ServiceNow platform to automate and simplify the management of network service requests. By

utilizing features such as the Service Catalog, Catalog Variables, UI Policies,

Custom Tables, Flow

Designer, Approval Management, and Email Notifications, the system provides a well-organized

workflow that manages requests efficiently from submission through completion.

The automation implemented in this project reduces manual intervention, speeds up request

processing, and ensures that every request follows a standardized workflow. Automated approvals,

record management, and notification services improve communication, maintain accurate request

tracking, and support compliance with organizational policies and Service Level Agreements (SLAs).

In conclusion, the project delivers a flexible, scalable, and user-friendly solution for managing

network requests. It enhances operational efficiency, improves the overall user experience, and

establishes a strong framework that can be extended in the future by integrating additional network

services and advanced automation capabilities.
